Why we need QCD axion?

$\bar{\theta} = \theta_{\text{vac}} + \arg \det(Y_u Y_d)$ SU(3)color vacuum topology quark sector

Strong CP problem: $\mathscr{L}_{\text{QCD}} \supset \bar{\theta} \frac{g_s^2}{32\pi^2} \tilde{G}^{a\mu\nu} G^a_{\mu\nu}$ (CP-violation term)

- [theory: $\bar{\theta} \in (0, 2\pi)$] vs. [experiments: $\bar{\theta} \leq 10^{-10}$] (neutron electric dipole moment)
 - Why θ is so unnaturally small (Fine-tuning)?
 - strong CP problem
 - Shuailiang Ge (PKU)

Solution: Peccei-Quinn (PQ) mechanism

$$(N_{\rm DW} = 1)$$

open walls bounded by strings

Closed domain wall

Fate of closed domain walls?

>> Collapses and oscillates. Energy released mainly in the form of free axions. Nothing interesting.

>> Schwartzchild radius $R_S = 2GM$. If the wall radius $R < R_{s}(R, t)$, a Black Hole is formed!

 $M = 4\pi R^2 \cdot \sigma$ where σ is the domain wall surface energy (i.e., tension) so the criterion becomes:

 $R > 1/(8\pi G\sigma)$

(Widrow, 1989) (Vachaspati, 2017) **(SG**, 2019)

Different Scenarios of Axion Cosmology

The formed strings will be blown away by inflation; Axion field gets homogenized; No axion domains walls can form.

String-wall network will form.

- >> Pre-inflationary scenario: PQ symmetry breaks before inflation. $f_a \gtrsim H_I/2\pi$
- >> Post-inflationary scenario: PQ symmetry breaks after inflation. $f_a \lesssim H_I/2\pi$
- >> During-inflation scenario: PQ symmetry breaks during inflation. String-wall network will form but re-enters horizon much later.
 - $f_a \sim H_I/2\pi$

Shuailiang Ge (PKU)

9

During-inflationary Scenario

$$f_a \sim H_I / 2\pi$$
:

This scenario can be naturally realized if the PQ symmetry breaking driven by inflation, for example: see e.g., couple the PQ field Φ to the inflaton field ϕ via $c\phi^2 \Phi^{\dagger} \Phi$ (Keisuke Harigaya, Lian-Tao Wang, 2022), (Michele Redi, Andrea Tesi, 2022) PQ symmetry breaks when ϕ rolls down to $\phi = \sqrt{\lambda/2cv_a}$.

>> During-inflation scenario: PQ symmetry breaks during inflation. String-wall network will form but re-enters horizon much later.

fine-tuning? NO!

This relation is not necessary

(Haipeng An, Chen Yang, 2023)

During-inflationary Scenario

$T_{\rm en}$: the temperature of re-entering horizon

Size of closed axion dom

nain walls:
$$R \sim H^{-1}(T_{en})$$

Criterion for PBH formation

Numerical calculation:

$$\mathcal{L} = 1/2(\partial_{\mu}\phi)^{2} - V_{a} \qquad V_{a} = m_{a}^{2}(T)f_{a}^{2}[1 - \cos(\phi/f_{a})]$$
Equation of motion:
$$\left[\partial_{t}^{2} + \frac{3\partial_{t}}{2t} - \frac{\partial_{\mathcal{R}}^{2}}{a^{2}(t)} - \frac{2\partial_{\mathcal{R}}}{a^{2}(t)\mathcal{R}}\right]\tilde{\phi} + m_{a}^{2}(t)\sin\tilde{\phi} = 0$$

$$\mathcal{R} = R/a(t) \text{ co-moving distance}$$

nitial condition:

$$\tilde{\phi}(t = t_2, \mathcal{R}) = 4 \{ \tan^{-1} [e^{m_a}]$$

 $a/f_a = 2\pi$ $_{i}(t_{2})(\mathcal{R}-R_{2})$ + $\tan^{-1}[e^{m_a(t_2)(-\mathcal{R}-R_2)}]$ -2 -4 Ζ. $a/f_a = 0$ -1

Criterion for PBH formation

Criterion: $R < R_s(R, t)$ $R_s = 2GE(t, R)$ $S(t,R) \gtrsim m_{\rm P}^2$

The maximum value of $S(\tilde{t}, \tilde{r})$ during the collapse is

 $S_{\rm max}$

We get, $\frac{S_{\max}}{f_a^2} = \begin{cases} 19.66(m_a R_0)^{2.74}, & T_{\rm en} \lesssim T_c \\ 3.1 \times 10^3 [m_a(T_{\rm en}) R_0]^{2.76}, & T_{\rm en} \gtrsim T_c \end{cases}$

$S(t,R) \equiv 2E(t,R)/R$

$$= \max_{(\tilde{t},\tilde{r})} S(\tilde{t},\tilde{r})$$

(Vachaspati, 2017) **(SG**, 2019)

Criterion for PBH formation

 $5.8 \times 10^{-10} M_{\odot} \lesssim M_{\rm PBH} \lesssim 0.62 M_{\odot}.$

$$(N_{\rm DW} = 1)$$

$\mathcal{A} = 64.7\%$, fraction of lattice cells occupied by a piece of wall.

$$\gamma = 0.80\%.$$
 $\gamma \equiv rac{ ext{total closed v}}{ ext{total DW are}}$

The simulation results are independent of axion parameters or T_{en}

(Received 13 November 2019; revised 10 February 2020; accepted 26 June 2020; published 29 July 2020)

We highlight that the anomalous orbits of trans-Neptunian objects (TNOs) and an excess in microlensing events in the 5-year Optical Gravitational Lensing Experiment data set can be simultaneously explained by a new population of astrophysical bodies with mass several times that of the Earth (M_{\oplus}) . We take these objects to be primordial black holes (PBHs) and point out the orbits of TNOs would be altered if one of these PBHs was captured by the Solar System, inline with the Planet 9 hypothesis. Capture of a free floating planet is a leading explanation for the origin of Planet 9, and we show that the probability of capturing a PBH instead is comparable. The observational constraints on a PBH in the outer Solar System significantly differ from the case of a new ninth planet. This scenario could be confirmed through annihilation signals from the dark matter microhalo around the PBH.

There are hints of a novel object ("Planet 9") with a mass $5 - 10 M_{\oplus}$ in the outer Solar System, at a distance of order 500 AU. If it is a relatively conventional planet, it can be found in telescopic searches. Alternatively, it has been suggested that this body might be a primordial black hole (PBH). In that case, conventional searches will fail. A possible alternative is to probe the gravitational field of this object using small, laser-launched spacecraft, like the ones envisioned in the Breakthrough Starshot project. With a velocity of order .001 c, such spacecraft can reach Planet 9 roughly a decade after launch and can discover it if they can report timing measurements accurate to 10^{-5} seconds back to Earth.

If time allows...

collapse of walls bounded by strings

Gravitational waves are mainly generated during the scaling regime of the string wall-network

scaling regime: roughly one piece of wall per horizon volume $\rho_{\rm DW} = \mathcal{A}\sigma_{\rm DW}H$ A is an $\mathcal{O}(1)$ number $\rho_{\rm DW}(t) \propto H(t)$

DW networks radiate GWs with the power

 $\rho_{\rm GW} = \epsilon P_{\rm GW} t / H^{-3} = \epsilon G \mathcal{A}^2 \sigma_{\rm DW}^2$

 $P_{\rm GW} \sim G \ddot{Q}_{ii} \ddot{Q}_{ij}$ where $Q_{ij} \sim \mathcal{A}\sigma_{\rm DW} H^{-4}$ $Q_{ij} \sim \mathcal{A}\sigma_{\rm DW} H^{-4}$

Define the GW spectrum as,

At the peak frequency,

$$\Omega_{\rm GW}(f_p, T_0)h^2$$

 $\simeq 6.5 \times 10^{-10} \mathcal{A}^2 \tilde{\epsilon} \cdot \left[\frac{10.75}{g_*(T_d)}\right]^{4/3} \left(\frac{d}{10^6}\right)^{10}$

Simulation result of the corresponding GW spectra

(T. Hiramatsu et al 1207.3166)

Shuail

In the cases below, there is no scaling-regime dynamics. The network collapse at $T_{\rm en}$ becomes the dominant source.

The dynamics of collapse of walls bounded by strings can be parameterized as:

$$R(t) \simeq R_0 \mathrm{e}^{-c_R \cdot rac{\omega_R}{\pi}}$$

exponential decrease of the amplitude due to energy loss into free particles

 $c_R \sim \mathcal{O}(0.1)$ inferred from the numerical result of (S. Chang, C. Hagmann,

Lorentz factor of the resultant free axions $\gamma_a \approx 3.2$, (see e.g., T. Hiramatsu et al, 2012;

Approximately, $\omega_R \sim \pi/2 \cdot \langle v_a \rangle / R_0$

and P. Sikivie hep-ph/9807374)

M. Kawasaki et al, 2015),

collapse of walls bounded by strings

Overproduction of free particles

Overproduction of free particles

To avoid the overproduction, we require free particles to further decay into relativistic species. (not disturbing BBN)

1. Decay into SM particles: $\mathcal{L}_{a\gamma\gamma}$

2. Decay into dark photons:

 $\mathcal{L}_{a\gamma'}$

The resultant dark photons may help alleviate the Hubble tension, see (Ligong Bian, sG, Changhong Li, Jing Shu, Junchao Zong, 2212.07871)

$$\mathcal{L}_{a\gamma\gamma \text{ or } agg} = \frac{1}{4} \frac{\beta_{\gamma}}{f_a} a F_{\mu\nu} \tilde{F}^{\mu\nu}, \text{ or } \frac{1}{4} \frac{\beta_g}{f_a} a G_{\mu\nu} \tilde{G}^{\mu\nu}.$$
$$\Gamma_{a \to \gamma\gamma, gg} = \frac{\beta_{\gamma, g}^2}{64\pi} \frac{m_a^3}{f_a^2}.$$

$$\gamma' = \frac{1}{4} \frac{\beta_{\gamma'}}{f_a} a F'_{\mu\nu} \tilde{F}'^{\mu\nu},$$

1. A detailed solution of the cosmic evolution of the multiple components (axions decaying into dark photons) during the BBN epoch. Related to Hubble tension and dark matter abundance.

2. The GW spectra of gauge strings (i.e., cosmic strings) will also be significantly altered by the scenario of re-entering horizon.
